CTTL Try-It! Mini-Grant Results Report

- 3) Assertively addressing situations involving conflict with patients and/or fieldwork educators; and
- 4) Applying the AOTA Code of Ethics and National Board for Certification in Occupational TherapyNBCOT) Practice Standards to clinical situations.

Eachtheme wasaddressed during one class meeting of MSDTAO. Videos from the ICE Video Librarywere selected to correlate with each of themes a case was constructed aroutine selected video content to provide the students with situational context from which to view the video. Each week, the class content included a review of information relevant to the thoeme assist students in effectively working through the cases dents watched the videos as a large group in class, then worked in small groups to disquessitions that guided the students through collaborative development of a plan of action as available for consultation during plan development. Each class session ended with a discussion of the sgraph conversations and a debriefing of the experience.

To measure the effectiveness of this classroom experience, students completed and post-survey regarding their perceived confidence and competence relaterate four themes and tooverall preparedness for the professional behaviorated aspects of Level II Fieldwork Additionally, students completed a written reflection assignment to allow for more thorough processing of learning that occurred through the lass experiences and fanalysis of areas in need of further development.

Objectives for this project included the following:

- To provide a baseline understanding of student perception of preparedness for Level II Fieldwork
- 2) To determine whether or not engagement in videasedcase study classroom activitiesimpacts

responding to feedback, demonstrating consistent		
work behaviors, demonstrating effective time		
management, demonstrating positive interpersonal		
skills, demonstrating respect for diversity).		
I feel confident articulating my clinical reasoning who	34%	73%
discussing evaluation results, goal development,		
intervention planning, and discharge planning with		
fieldwork educators, patients, and patients' families.		
I feel confident communicating with fieldwork	78%	81%
educators during challenging situations.		
I feel confident addressing conflict with patients,	57%	69%
patients' families, and/or fieldwork sitetaff.		
I feel confident applying the AOTA Code of Ethics a	76%	98%
the NBCOT Practice Standards in a clinical setting		
I feel confident in my clinical reasoning process.	59%	77%

Qualitative responses gathered throughdividual student critical reflections related to the Video Case Study activities also indicated an overall positive response to engagement in the activities. 51 of the 52 participants described the positive impact of the activities on their perceived peparedness for Level II Fieldwork. Autudent stated:

I feel like the four case studies really helped me prepare for my upcoming Level II Fieldwork. I learned more about the process of clinical reasoning and was able to practice my emerging skills in slexcting patient cases and focusing on important issues. In addition to learning more about clinical reasoning, the video case studies also gave me the opportunity to practice how I would handle ethical dilemmas and situations of conflict involving a supersor or clinical instructor. I learned that, during fieldwork, there may be times where I will have to be assertive and advocate for myself and my learning needs. Throughout the video case studies, I also learned the importance of being proactive in my learning during fieldwork. It will be important(i)10((ad)-4d(e)4(e)3((i)to2(patents)).

- fear, anxiety, and "stage fright" that often acompany roleplaying activities. Additionally, students who are typically more reluctant to participate in fullass discussions were able to work collaboratively in small groups to brains torm ideas prior to sharing solutions with the entire class.
- x Increased levels of student reflect on their preparation for the professional behavior-related aspects of Level II Fieldwork and futpractice—In the past, our students have had a tendency to focus solely on developing clinical competence as they prepare for Level II Fieldwork. Students described appreciation for "naming the elephant in the room" and talking about challenges that can occur during Level II Fieldwork and future practice. Students indicated appreciation for the discussion of various strategies for engaging in the professioned avioraspects of fieldwork and the discussion of resources available to students during their fieldwork.
- x Connecting the professional behavior concepts to the existing video cases available through the ICE library was not as challenging as originally anticipated. Because the main focus of the library is to provide a clinical education resource for students, therapists, and educators, I was initially concerned about my ability to effectively make connections to the concepts I had chosen to include relassroom activities. As I watched more and more of the videos, it was easy to select cases that correlated with the selected themes. Construction of the situational context provided to the students for each of the activities was creatively challer agridg actually quite fun. Drawing from personal experience (in the clinic as an occupational therapy student, as an occupational therapist, and as a fieldwork educator, in addition to my experience working with fieldwork students and fieldwork educators overthe past two years) ensured the situational context was relatable and realistic.

While I feel that, overall, this project was a success, it was not without its challengers is significant barriers to successful implementation of this project were structural:

- x The classroom was at full capacity, so navigating the rearrangement necessary for small-group discussions was fficult for the students and also for me, as I tried to make my way to each of the groups to consult during signallup discussions.
